SUMMARY

I build AI agents and the infrastructure that decides what they are allowed to do, and I take customers from signed agreement to a working system they actually use. Six agents built for three organizations and deployed with one of them, a deployed MCP server, a published integration contract verified against ChatGPT and Claude as clients, and an agent evaluation harness that grades a product's customer journey against a versioned rubric. Seventeen years customer-facing across construction, media production, and software, currently running delivery on two multi-million dollar reconstruction programs. Claude Code and Codex in terminal daily, as the method rather than as autocomplete.

AI SYSTEMS AND AGENT INFRASTRUCTURE

- **Six agents built for three organizations, deployed and trained with one.** Each got a staff-facing agent that could publish and edit records and a customer-facing agent that could only read, split on permissions so the two never shared a trust boundary. A small always-loaded controller prompt pointed at a versioned specification document with an explicit precedence rule, keeping six deployments as configuration rather than six forks. Industry compliance encoded as agent behavior, including fair-housing rules prohibiting steering on protected class.
- **Structural grounding, not instruction.** Verified system data stated as fact; model knowledge carrying a mandatory disclosure marker. Backed by roughly 62 test files including anti-hallucination and server-authority suites verifying the model never invented or overrode identifiers the server owns.
- **Published and verified integration contracts.** A versioned MCP tool manifest with full input and output schemas, parameter constraints, and tiered field access, served alongside OpenAPI at both the standard and /.well-known/ paths, then verified end to end by connecting ChatGPT and Claude as clients and reading and seeding data through the API. Sendiment is a deployed remote MCP server on Cloudflare Workers and D1 that any assistant can connect to.
- **Agent evaluation harness.** Tribute drives a real browser through a product's first-time customer journey with Playwright and grades five defined stages against a rubric versioned in the repo, with explainable reasoning on every score. TypeScript monorepo, Manifest V3 extension, Zod-validated data shipped through CI to a CDN.
- **Bounded autonomous runs.** An ingestion agent over eleven tools that expanded its own work queue with visited-URL state held in code outside the model's context, three independent stop conditions, and separate decision and proof logs. Per-provider daily budget ceilings rather than one global cap. A full non-LLM fallback path so the system degrades to a real answer instead of an error.
- **Untrusted input and output, both directions.** User-supplied text delimited and framed as data before reaching a prompt, SSRF-safe URL validation before any fetch, robots.txt parsed and cached per origin; on the way out, tolerant parsing, score clamping, and per-field caps.

IMPLEMENTATION AND CLIENT DELIVERY

- **Owned an enterprise implementation end to end, solo.** Ran Compass Los Angeles from pitch through technical discovery, configuration, data setup, go-live, executive and field-user training, and ongoing management as the only technical person on the engagement. Built the weekly reporting that proved it was working: a scheduled job joining verified activity with feedback and emailing participation, response rates, intent signals, and verbatim comments every Monday.
- **Current delivery on two multi-million dollar programs.** Own scope, schedule, budget, risk register, and dependency sequencing across trades, architects, engineers, city inspectors, insurers, and homeowners, none of whom report to me. Use ArcGIS to pull utility locations and zoning, Coastal Commission, and hillside requirements for the trades.
- **Caught what three specialists missed.** Three 10-by-3-foot clerestory windows were left out of a window schedule though they were drawn in the elevations. Nobody had checked one document against the other and the order was about to go out. I read the plans against the order. Seven weeks of lead time, \$18,000 in windows, and reframing the north side of the residence.
- **Restarted a stalled engagement.** Inherited a project with six parties waiting on each other and no documented dependencies. Mapped the critical path, put named owners against dated commitments, caught engineering deficiencies others had missed, and brought it to completion.

SYSTEMS AND ENABLEMENT THAT OUTLAST THE BUILDER

- **Paramount+.** Found a structural risk nobody had named across three asset-tracking systems handling tens of thousands of assets a year for 200 productions on two Burbank stages, built the business case around the failure mode rather than the inefficiency, and secured funding. Designed and operated the replacement as the single source of truth for 60-plus

subcontractors across multiple states. Daily processing from six hours to 30–45 minutes, error margin to effectively zero, throughput tripled, \$3M annual portfolio, no added headcount. Wrote the playbooks the department standardized on and ran fundamentals workshops until a team that had resisted the change ran it without me. The system outlived the org chart that commissioned it.

- **Replaced two commercial SaaS products.** Studied where Pike13 broke down for a studio, then built the replacement across enrollment, scheduling, attendance, billing, curriculum progress, parent portal, and admin operations, for a studio running hundreds of students across two locations with 20 employees. In beta, working end to end including Stripe checkout against test data. Postgres with no ORM: 16 tables, 12 enum types, 21 ordered raw-SQL migrations, views and triggers, migrations gated in CI ahead of deploy. Two independent authorization layers so a new endpoint fails closed rather than leaking by omission, and versioned consent records with typed initials, timestamp, and document version.
- **Apple.** Thousands of technical workshops across six years, for audiences from first-time users to enterprise IT. Built onboarding curriculum other people delivered without me in the room, which means encoding judgment rather than steps.

EXPERIENCE

Elcano Construction — Professional Services Program Manager	2025 – Present
Flypost — Founder & Product Lead	2022 – 2024
Paramount+ — Technical Producer, Creative Content	2022 – 2024
Alyce’s Art Studio — Web Platform and Class Management System	2017 – Present
Film & Media Production (Netflix, Amazon, WBD) — DIT & Solutions Architect	2013 – 2025
Apple Inc. — Technical Educator & Team Lead	2008 – 2014
• Also built: HireNear (human-in-the-loop hiring scout, ~9,500 lines), Superintend (AI layer over project tracking with dry-run diffs and contract-tested adapters), Boardwatch (polls 200-plus job-board APIs daily, scores new matching rules against a labeled set before adopting them), Table Read (screenplay-to-speech with local neural TTS and three-tier graceful degradation), lagsnap (Chrome extension for LLM screenshot workflows).	

SKILLS

- **AI:** agent specification and context files, prompt design and refinement, grounding and guardrail architecture, output-quality measurement and rubrics, anti-hallucination testing, tool-use loops, MCP servers and manifests, token and cost governance, human-in-the-loop design, Claude Code, Codex
- **Delivery:** implementation from signed agreement to go-live, technical discovery, escalation ownership, data migration, customer training, playbooks and handoff documentation, scope and change control, risk registers, executive reporting, stakeholder alignment without authority
- **Engineering:** TypeScript, JavaScript, Node/Express, React, PostgreSQL and raw SQL migrations, REST and OpenAPI, ETL and structured pipelines, Docker, Google Cloud Run and Cloud Build, Cloud SQL, Firebase, Cloudflare Workers and D1, Playwright, GitHub CI/CD, Stripe
- **Commerce and marketing:** Webflow, CMS architecture, technical SEO, e-commerce catalog and checkout, Mailchimp, Resend, email deliverability (SPF, DKIM, DMARC, MX), Airtable, ArcGIS, Linear

EDUCATION & CERTIFICATIONS

University of Utah — Bachelor of Music, Jazz Composition	2010
• Apple Certified Support Professional Certified ScrumMaster (in progress) OSHA 30-Hour (in progress)
