

BENJAMIN MOWER

Santa Monica, CA | benjaminmower@gmail.com | linkedin.com/in/benjaminmower | github.com/benjaminmower

SUMMARY

Program and product leader who ships agent systems end to end and defines the guardrails, evals, and rollout plans that make them safe to point at real operations. 17 years running delivery for physical, high-consequence work — construction program management, streaming content operations, and film production — plus production agentic systems built on Claude and GPT. Takes zero-to-one products from scope through enterprise pilot, and measures agent behavior against deterministic baselines before it gets authority.

AI SYSTEMS & AGENT IMPLEMENTATION

Superintend — Schedule Risk Agent

2026 – Present

Live on active multi-million dollar reconstruction projects · github.com/benjaminmower/superintend

- Built and deployed an AI layer on the Google Sheets tracker two active construction programs already run on — 280 items, 51 subcontractors, 39 weekly tabs, ~3,100 recorded edits — writing a risk flag and one specific next action per item.
- Scoped adoption cost to zero as a hard requirement: the sheet stays the only interface field and office teams touch, writes are allow-listed to AI-owned columns, and the rollout is fully reversible. Change management as a design constraint, not a training plan.
- Architected a source-agnostic TrackerSource interface with capability flags so a CSV export or a Procore integration degrades gracefully instead of failing — then shipped a single adapter first rather than building for customers who don't exist yet.
- Defined success criteria before results: deterministic risk rules backtested against real change history for precision, recall, and lead time against three published baselines, with the outcome definition frozen in advance so results can't be tuned retroactively.
- Designed the agentic layer as a measured upgrade — rules generate candidates, an agent investigates each with read-only tools and returns a validated verdict — that ships disabled unless the eval proves it beats the deterministic baseline.

Flypost Agent — Autonomous Ingestion Harness

2022 – 2026

Production agentic pipeline

- Built the harness: Claude Sonnet in a tool-use loop over a registry of eleven tools spanning fetch, extraction, deduplication, publication, logging, and source-queue management.
- Made context management explicit rather than leaving it to the model — loop state tracked outside the context window, with the agent expanding its own work queue mid-run by discovering and queueing new sources.
- Enforced token, wall-clock, and source-count budgets per run, keeping an autonomous loop bounded and cost-predictable in production.

Brokerage Concierge Agents

2024 – 2026

Multi-tenant agent deployment — 6 deployments across 3 brokerages

- Shipped six agent deployments on shared primitives with per-tenant configuration and versioned specifications, each with separate authoring and consumer variants split on write permissions.
- Built a two-tier grounding architecture separating verified API data, stated as fact, from model prior knowledge, which carries a mandatory disclosure marker — hallucination containment by structure rather than instruction.
- Encoded regulatory guardrails directly into agent behavior, including fair-housing constraints prohibiting steering on protected class, with hard boundaries between where the agent may improvise and where output is deterministic.

HireNear & Sendiment

2025 – Present

Human-in-the-loop pipeline · public MCP server

- Designed HireNear's agent/human division of labor explicitly — the agent handles discovery, signal extraction, and fit scoring; the person owns every outreach decision, because the cost of a wrong automated contact lands on the job seeker.
- Published Sendiment as a remote MCP server on Cloudflare Workers with D1, a versioned server manifest, and a streamable-HTTP endpoint, so any assistant can connect — with agent-authored content rendered visibly distinct from human.

PROGRAM DELIVERY

Elcano Construction — Palisades Fire Reconstruction

2025 – Present

Professional Services Program Manager

- Run delivery across two simultaneous multi-million dollar reconstruction programs, owning scope, schedule, risk register, and dependency sequencing across trades, architects, engineers, city inspectors, insurers, and homeowners — none of whom report to me.
- Prevented an estimated seven-week schedule delay by identifying critical omissions before execution and escalating with a clear recommendation before the plan broke.

Paramount+

2022 – 2024

Technical Producer / Cross-Functional Program Manager — Creative Content

- Owned delivery across a \$3M annual program portfolio and dozens of concurrent engagements, coordinating internal teams, ~40 subcontractors across multiple states, and executive stakeholders.

- Identified an unnamed structural risk in an asset pipeline handling tens of thousands of assets annually with no unified path, built the business case, secured budget, and shipped the replacement — error margin to effectively zero, throughput tripled, processing time down 60% with no added headcount.
- Designed and personally operated the production tracking system underneath it: base architecture, dependency logic, workflow automations, and reporting views that became the department's single source of truth for personnel, schedules, and delivery status — plus the documentation the team standardized on.

Flypost

2022 – 2026

Founder & Product Lead

- Took a zero-to-one product from scope to enterprise pilot alone in three months against a six-month team estimate — GCP Cloud Run, Firestore, REST APIs, CI/CD on GitHub.
- Ran the Compass Los Angeles pilot end to end, from first pitch through deployment, executive and field-user training, and ongoing account management.
- Killed the per-brokerage roadmap on competitive signal when Redfin and Compass shipped their own AI, concluding that one brokerage at a time could not outpace incumbents shipping to an entire network.
- Pivoted to presence verification at open houses, shipped it to a design partner where it performed as designed, then shut it down on user behavior rather than technical failure: buyers wouldn't give honest feedback because it weakened their negotiating position — a conflict no interface change could resolve.

EARLIER EXPERIENCE

Film & Media Production — Netflix, Amazon, Warner Bros. Discovery

2013 – 2025

Digital Image Technician & Solutions Architect

- Designed and operated custom technical systems under zero-failure conditions, architecting redundancy, sequencing dependencies, and making real-time calls when the plan met reality.
- Built chain-of-custody logging and verification workflows across the content delivery lifecycle, where originals were irreplaceable and a failed handoff could not be recovered by re-running the step. Metadata management was central to the role, not peripheral.

Apple Inc.

2008 – 2014

Technical Educator & Team Lead

- Delivered thousands of technical workshops over six years to audiences from first-time users to enterprise IT, translating complex systems into actionable instruction.

SKILLS

AI systems: agent harness and tool-registry design · tool-use loops · context management and grounding · hallucination containment · RAG with citation validation · evals, backtesting, and error analysis · human-in-the-loop design · guardrails and allow-listed write paths · agent observability and tracing · prompt and context engineering · MCP servers and tool manifests · token budgeting and cost/latency/quality tradeoffs · Anthropic and OpenAI APIs.

Product & program: discovery and requirements definition · roadmap and prioritization · scoping and tradeoff decisions · success criteria and measurement design · cross-functional stakeholder management · executive communication · rollout, adoption, and change management · implementation and onboarding · integration and partner API evaluation · risk registers and dependency tracking · Agile and Waterfall delivery · vendor and external partner accountability.

Technical: Python · JavaScript/TypeScript · REST APIs, OpenAPI, OAuth 2.0 · Google Cloud Platform (Cloud Run, IAM, Firestore) · Cloudflare Workers + D1 · SQLite/FTS5 · Playwright · server-sent events · pytest and contract testing · Git and CI/CD · Airtable · Linear.

Domain: construction program management and trade sequencing · permitting, LADBS plan check, and Title 24 · media production operations, asset tracking, and metadata · proptech.

EDUCATION & CERTIFICATIONS

University of Utah — Bachelor of Music, Jazz Composition · 2010

Apple Certified Support Professional · Certified ScrumMaster (CSM, in progress) · OSHA 30-Hour (in progress) · PMP (planned)
